

Ten Lectures on Basic Science of Laser Phototherapy

Contents

Preface

Lecture 1. Introductory remarks. Where we are and whither we move?.....	
1.1. Laser biostimulation appeared to be a photobiological phenomenon. Does this finding have a broader biological meaning?	
1.2. Perspective developing areas of laser phototherapy.....	
1.2.1. Irradiation reverses the toxic effects of neurotoxins and retinotoxins.....	
1.2.2. Promotion of functional recovery of injured peripheral nerves and spinal cord.....	
1.2.3. Light therapy in case of stroke, acute myocardial infarction and coronary angioplasty.....	
1.2.4. Stimulation of proliferation of satellite (stem) cells.....	
1.2.5. Laser therapy for prevention and treatment of oral mucositis induced by chemotherapy.....	
1.2.6. Possible stimulation of fertilization (light action on spermatocytes)	
1.2.7. Biotechnology.....	
1.2.8. Blood irradiation.....	
1.2.9. Antagonizing effect of light on the myotoxic and/or muscle damaging activity of viper snake venom.....	
1.2.10. Old knowledge - revisited with the same conclusions.....	
Lecture 1– Key Points	
Lecture 2. Brief history. Light properties and parameters important in contemporary phototherapy.....	
2.1. Historical perspective.....	
2.2. Light coherence. Is this property of light important when biological objects are irradiated?.....	
2.2.1. Coherence of light.....	
2.2.2. Coherence of light interaction with biomolecules, cells, and tissues	
2.3. Parameters of light.....	
2.4. Elementary photochemistry and photobiology.....	
2.5. Irradiation techniques for a work on cellular level.....	
Lecture 2– Key Points.....	

Lecture 3. Dependence's of biological responses of cells on parameters of radiation: dose intensity, polarization.....

- 3.1. Dose and intensity of CW radiation. Reciprocity rule.
- 3.2. Dose dependence's for various wavelengths and biological responses.....
- 3.3. Dose and intensity of pulsed and pulse-modulated radiation.....
 - 3.3.1. First hints that cellular responses to CW and pulsed radiation differ
 - 3.3.2. Dark period between pulsed is a more important parameter than pulse width.....
 - 3.3.3. Several bell-shaped maxima can be induced by pulse-modulated light
- 3.4. Dose interval
- 3.5. Light polarization.....
- Lecture 3– Key Points.....

Lecture 4. Dependence's of biological responses of cells on parameters of radiation: wavelength and monochromaticity. Modification on light responses with chemicals.....

- 4.1. Wavelength. Action spectra
- 4.2. Monochromaticity (bandwidth).....
- 4.3. Modification of light effects with dichromatic irradiation.....
 - 4.3.1. Simultaneous irradiation
 - 4.3.2. Consecutive irradiation.....
- 4.4. Modification of light effects with chemicals.....
- Lecture 4– Key Points.....

Lecture 5. Identification of photoacceptor molecules

- 5.1. Analysis of action spectra recorded on mammalian cells
- 5.2. Comparison of action and absorption spectra in case of mammalian cells. Effects of irradiation on the absorption spectra of whole cells. Cytochrome c oxidase as the photoacceptor in visible-to-near IR region
- 5.3. Comparison of action and absorption spectra of prokaryotic cells *Escherichia coli*.
- Lecture 5– Key Points.....

Lecture 6. Cellular signaling pathways

- 6.1. What types of reactions are involved?.....
 - 6.1.1. Prevention and elimination of detrimental effects of chemicals.....
- 6.2. A novel mitochondria-signaling pathway activated by radiation of visible-to-near IR region.....
 - 6.2.1. Modification of the light action with chemicals that act on the respiratory chain.....
 - 6.2.2. Modification of the light action spectrum with molecules acting via interaction with cell membrane.....
 - 6.2.3. How the mitochondria signaling pathway works?.....
- 6.3. Oxidants increase cell attachment.....

- 6.4. Antioxidants eliminate the light effect
 - 6.4.1. Action of small molecules that are able to penetrate into a cell.....
 - 6.4.2. Action of non-permeable antioxidative enzymes.....
 - 6.4.3. Action of thiol-reactive chemicals.....
- 6.5. Could phospholipase A₂ pathway be involved into light signaling?.....
- Lecture 6– Key Points.....

- Lecture 7.** How the cellular signaling works?.....
 - 7.1. Transmission of photosignal from mitochondria to other cellular organelles
 - 7.2. What occurs with the photoacceptor molecule after light absorption?.....
 - 7.3. Multiple functions of mitochondria.....
 - 7.4. Initiation of DNA replication and division of *Echerichia coli*
 - 7.5. An explanation of the bell-shaped form of dose dependence's.....
 - Lecture 7– Key Points.....

- Lecture 8.** Irradiation effects are detectable in cells of next generations.....
 - 8.1. Proliferation of mammalian cells
 - 8.2. Changes in growth of next generations of microorganisms.....
 - 8.3. Mitochondrial ultrastructure of cells–descendants of irradiated cells *Torilopsis sphaerica*.....
 - 8.3.1. Growth and morphometric characteristics of the yeast cultures irradiated by He-Ne laser light.....
 - 8.3.2. Ultrastructure of the giant mitochondrion of cells-descendants bears the signs of activation.....
 - 8.3.3. Increased number of mitochondria-endoplasmic reticulum associations.....
 - 8.3.4. Damaging effect of He-Ne laser in radiation at higher on the mitochondria of cell-descendants.....
 - 8.3.5. What conclusions can be drawn from these experiments?.....
 - Lecture 8– Key Points

- Lecture 9.** Other examples of cellular activation via mitochondria.....
 - 9.1. Excitable cells.....
 - 9.1.1. Nerve cells (electrophysiological measurements).....
 - 9.1.2. Nerves and cardiomyocytes (patch clamp measurements).....
 - 9.2. Human lymphocytes – (redox) priming by laser radiation.....
 - Lecture 9– Key Points.....

- Lecture 10.** Activation of other redox chains. Differences between cellular responses to CW and pulse-modulated light.....
 - 10.1. Is the respiratory chain the only redox chain that can be activated by irradiation?.....
 - 10.2. Cellular responses to CW and pulsed - modulated light may differ.....

- 10.3. Dark period between pulses is the decisive parameter when comparing the action of pulsed and CW radiation of the same wavelength and dose
- 10.4. Direct and indirect activation of cells
- Lecture 10– Key Points.....

Concluding remarks. My 25 years in the field of laser phototherapy.
